

Team Up with AG Gas to Win CO₂ Enrichment Projects

As a Chart distributor, supplying CO₂ tanks and gas is your business. At AG Gas, making optimal use of CO₂ within a crop growing environment is ours. We'd like to work with you to tackle the expanding market for CO₂ enrichment, whether it be in the cannabis industry or in controlled environment agriculture more generally.

Along with water and light energy, CO₂ is a necessary ingredient in photosynthesis – and it is often the limiting factor. Just as growers have long since figured out how to cost-effectively provide sufficient water and light to maximize their yields, the same can now be said of CO₂. The key is to *safely* deliver this invisible nutrient where and when it is needed.

The patented AG Gas system uses real-time environmental data – heat, light, ventilation and CO₂ readings – to dynamically apply low-pressure gas directly into the foliar canopy. Our system's life safety features are second-to-none and we take the lead in securing permits with local authorities.

As we develop prospects in your area, we'll be reaching out to collaborate on tank and gas solutions. We think that's a winning formula and we look forward to partnering with you on upcoming projects.

Please feel free to reach out to learn more, or to get our help in winning your own CO₂ enrichment projects.
