

Benefits for you:

- Economically attractive solution
- Prevention of potential unexpected failure and damage
- Longer life of your blades
- Increased operational reliability of your system
- Quick turnaround, in accordance with guaranteed scheduling
- You will receive an inspection and repair report
- Full cost control due to a fixed price. (If repair is possible)

Although all Howden cooling fans are designed for a long service life, conditions in which the fans are run may lead to wear of the blades over time.

By having the blades preventively refurbished by our specialists, you can extend the service life. We can also handle the entire removal and installation of the blades at your location.

Preventive measures avoid expensive alternative or unexpected failure. Reasons for repair include erosion of the wear edge and blade surface, and minor surface damage and cracks in the blades.

The solution:

Rather than replacing the blades (depending on their condition) it can be an attractive alternative to refurbish the blades.

The process, which is carried out by specialists, involves:

- Quick scan of the blades
- Blade repair and refurbishment
- Applying new top coating (leading edge protection optional)
- Blade balancing (vectorial)

Depending on the condition and findings, blades may be rejected during the quick scan and inspection.

The process:

- First we ask you to contact the Howden aftermarket department
- We assess your request and prepare an advise and offer for you
- A project reference number is generated based on your order and you will receive a shipping form
- This project reference number must be placed on the packaging before transport

For additional information please contact our aftermarket department:
